In Russian, indefinites with postfix -to receive a wide-scope and a narrow scope interpretations. Indefinites with different apparent scope are usually analyzed as ambiguous between choice functional and quantificational.

If -to indefinites were ambiguous, they would be able to be interpreted in any context. However, -to indefinites are not valid in genuine “non-specific” scenarios. Thus, they are not truly quantificational.

Both scope options can be accounted for if Russian -to indefinites are analyzed as instances of Parameterized Choice Function (Kratzer) and the notion of PCF is extended to parameterization by times.
